Introduction to Cardiovascular Physiology

The cardiovascular system, also known as the circulatory system, is responsible for transporting blood, nutrients, hormones, and waste products throughout the body. It comprises the heart, blood vessels, and blood. The primary functions include supplying oxygen and nutrients to tissues, removing metabolic waste, and maintaining blood pressure and pH balance.

Key Components of the Cardiovascular System

- The Heart: Acts as a pump to propel blood through the circulatory pathways. - Blood Vessels: Include arteries, veins, and capillaries, which facilitate blood flow. - Blood: Transports gases, nutrients, hormones, and waste products.

Structural and Functional Overview of the Heart

The heart is a muscular organ divided into four chambers: two atria and two ventricles. Its rhythmic contractions are driven by electrical impulses, enabling continuous blood circulation.

Heart Anatomy

- Right Atrium: Receives deoxygenated blood from the body. - Right Ventricle: Pumps blood to the lungs via the pulmonary artery. - Left Atrium: Receives oxygenated blood from the lungs. - Left Ventricle: Pumps oxygen-rich blood to systemic circulation through the aorta.

Cardiac Cycle and Function

The cardiac cycle encompasses systole (contraction) and diastole (relaxation), coordinating the filling and ejection of blood from the heart.

Electrical Conductance of the Heart

Electrical activity controls heart rhythm and ensures synchronized contractions.

Conduction System Components

- Sinoatrial (SA) Node: The natural pacemaker initiating impulses. - Atrioventricular (AV) Node: Delays impulses, allowing atrial contraction. - Bundle of His and Purkinje Fibers: Distribute impulses rapidly to ventricles.

Electrocardiogram (ECG)

An ECG records electrical activity, displaying waves (P, QRS, T) that correspond to specific phases of cardiac electrical events.

Hemodynamics and Blood Flow

Understanding blood flow dynamics involves principles like pressure gradients, resistance, and flow rate.

Key Concepts in Hemodynamics

- Blood Pressure: Force exerted by blood on vessel walls. - Flow (Q): Volume of blood passing a point per unit time. - Resistance (R): Opposition to flow, mainly from vessel diameter and length.

Factors Influencing Blood Flow

- Vascular resistance - Blood viscosity - Vessel elasticity - Cardiac output

Cardiac Output and Its Regulation

Cardiac output (CO) reflects the amount of blood pumped by the heart per minute and is vital for tissue perfusion.

Calculation of Cardiac Output

1. Heart Rate (HR): Number of heartbeats per minute.
2. Stroke Volume (SV): Volume of blood ejected per beat.

$CO = HR \times SV$

Regulatory Mechanisms

- Neural Control: Sympathetic and parasympathetic nervous systems modulate HR and SV. - Hormonal Control: Adrenaline and noradrenaline increase cardiac activity. - Intrinsic Factors: Preload, afterload, and myocardial contractility.

Blood Pressure Regulation

Maintaining optimal blood pressure involves complex interactions between cardiac output, blood volume, and vascular resistance.

Baroreceptor Reflex

Sensors in carotid sinus and aortic arch detect pressure changes and initiate reflexes to adjust HR and vessel tone.

Renin-Angiotensin-Aldosterone System (RAAS)

A hormonal system that increases blood volume and vasoconstriction, elevating blood pressure when needed.

Vascular Physiology

Blood vessels adapt to regulate blood flow according to tissue needs.

Types of Blood Vessels

- Arteries: High-pressure vessels distributing oxygenated blood. - Veins: Low-pressure vessels returning deoxygenated blood. - Capillaries: Thin vessels facilitating exchange of gases, nutrients, and waste.

Vascular Tone and Regulation

Vasoconstriction and vasodilation are controlled by neural, hormonal, and local factors, affecting blood flow distribution.

Capillary Exchange and Microcirculation

Efficient exchange occurs in capillaries through various mechanisms.

Mechanisms of Exchange

- Diffusion: Movement of gases and nutrients down concentration gradients. - Filtration and Reabsorption: Driven by hydrostatic and osmotic pressures. - Transcytosis: Vesicular transport of larger molecules.

Clinical Correlates of Cardiovascular Physiology

Understanding physiological principles aids in diagnosing and managing cardiovascular diseases.

Common Conditions

- Hypertension - Heart failure - Ischemic heart disease - Arrhythmias - Vascular diseases

Role of Physiology in Clinical Practice

- Interpreting ECGs - Managing blood pressure - Monitoring cardiac output - Understanding pharmacological effects

Summary and Key Points
