Working Principles of the Elcometer 456

Magnetic Induction and Eddy Current Techniques

The Elcometer 456 utilizes two primary techniques to measure dry film thickness:

Magnetic Induction (for Ferrous Metals)

1. When measuring coatings on ferrous substrates, the device employs magnetic induction.
2. A magnetic field is generated by the probe, which penetrates the coating and induces a magnetic response in the substrate.
3. The device calculates the coating thickness based on the magnetic response, which correlates with the distance between the probe and the substrate surface.

Eddy Current (for Non-Ferrous Metals)

1. For non-ferrous substrates such as aluminum, copper, or zinc, the gauge uses eddy current technology.
2. An alternating magnetic field induces eddy currents in the substrate.
3. The device measures the impedance change caused by

the coating and substrate interaction to determine thickness.

Calibration and Zeroing

1. Prior to measurement, the device must be calibrated using a standard calibration block or specimen with a known coating thickness.
2. Zeroing the instrument ensures that the measurement starts from a baseline, accounting for any surface irregularities or environmental factors.

Measurement Procedure

1. Select the appropriate mode based on the substrate type.
2. Calibrate the device if necessary.
3. Place the probe firmly against the coated surface, ensuring good contact.
4. Press the measurement button, and wait for the reading to stabilize.
5. Record the measurement, either manually or automatically stored in the device’s memory.

Applications of the Elcometer 456
