Fundamental Concepts in Mechanics of Materials

Stress and Strain

Understanding stress and strain forms the foundation of mechanics of materials.

1. **Stress**: The internal force per unit area within a material, typically measured in pascals (Pa). It can be normal (tensile or

compressive) or shear.
2. **Strain**: The measure of deformation representing the displacement between particles in a material body relative to a reference length.

Hibbeler emphasizes the importance of understanding the relationships between these quantities, including their elastic and plastic behaviors.

Elasticity and Plasticity

The textbook explores how materials deform elastically (reversible deformation) and plastically (permanent deformation), discussing:

1. Hooke's Law
2. Stress-strain curves
3. Elastic modulus, shear modulus, and Poisson's ratio

Axial Loading and Normal Stresses

This section covers analysis of members subjected to axial forces, calculating normal stresses, and understanding elongation or contraction.
